# Mithun Das

## Senior Backend & Platform Architect — Independent Contractor

Kolkata, India (UTC+5:30) · overlaps US mornings and all of Europe · mithun.das@jumacro.com · github.com/mithundas79 · linkedin.com/in/dasmithun

I build and operate production backends that businesses depend on daily: an **AI bookkeeping platform** posting into QuickBooks Online for a US accounting firm, and an **EV charge-point management system** speaking OCPP to live chargers. Nineteen years in software, the last decade contracting independently. My work sits where a wrong answer costs money — accounting, payments, banking data — so I design for the times a system is wrong, not only for the times it is right.

### SELECTED WORK

#### Paynthr — AI bookkeeping automation

2025 – present

Product, architecture, code, infrastructure and release. Live in production for a US accounting firm since June 2026.

- Documents arrive from Dropbox and email, are read by OCR and LLM extraction (Claude on AWS Bedrock, PaddleOCR, vector embeddings), categorised, and posted into QuickBooks Online.
- A per-client trust dial decides what posts unattended and what waits for a bookkeeper. Every accounting decision is grounded in explicit rules, so the model reads and suggests but never invents the accounting.
- 20+ Go microservices on AWS ECS behind CloudFront and an ALB, Aurora PostgreSQL with row-level security for tenant isolation, all infrastructure in Terraform, CI/CD on CodeBuild, React UI.
- Integrations: QuickBooks Online, Dropbox, Yodlee bank feeds, Stripe subscription billing with grace and lock states.

#### Electroop — EV charge-point management

2022 – present

Backend architect of the platform behind a live EV charging network.

- OCPP 1.6 / 2.0.1 WebSocket server handling live charge points; tenant, admin and public REST APIs; session and job services.
- Payment gateway interface, OCPI for roaming, and the backend for the mobile application.
- TypeScript on AWS (Lambda, ECS, PostgreSQL, Serverless Framework), with C# and Python components where the ecosystem required them.

#### AWS cost reduction and infrastructure codification

2025

- Took a console-built account nobody could explain, inventoried it, and rewrote the estate as Terraform.
- Cut the monthly bill **24 per cent**, $2,039 to about $1,550, across five levers — nothing cut that carried service impact, and the two judgement calls left to the owner.
- Budget alarms at 80 and 100 per cent, so the next drift reports itself instead of being discovered.

### EXPERIENCE

**Localghost / Electroop** — Backend & Platform Architect

2018 – present

Green-technology group. Platform and backend ownership; from 2022, architect of the Electroop charge-point management system described above.

**Independent contractor** — Backend & platform engagements

2013 – present

Contracting through my own company, Jumacro Software Services Pvt. Ltd. Accounting, fintech and SaaS products — most recently Paynthr, above.

- 47 completed engagements via Upwork (2013–2017), 2,400+ hours, 44 of them rated 5.0: Node and MEAN microservices, WebSocket real-time systems, MongoDB and Neo4j on AWS and Google Cloud, for food delivery, order management, dispatch and asset-tracking products.

**Pinpoint Media Design**— Chief Technical Consultant 2014 – 2018

Wasaga Beach, Ontario. Technical consulting on client software delivery.

## EARLIER ROLES

| | |
|---|---|
| **Lausitzer Rundschau**— Senior Software Architect | 2014 |
| **Rainmaker Technologies Inc.**— Software Engineer, Calgary | 2012 – 2013 |
| **iSolution Software Systems Pvt. Ltd.**— Project Manager | 2008 – 2012 |
| **Websitespundit**— Team Leader | 2008 |
| **Apex Division**— Senior Programmer | 2007 – 2008 |
| **Ejobindia**— Junior Programmer | 2006 – 2007 |

## TECHNICAL

**Languages and runtime**

Go · TypeScript · Node.js · Python · C# · React

**Cloud and infrastructure**

AWS ECS / Fargate · Lambda · Aurora · S3 · SQS · CloudFront · Terraform · Docker · CodeBuild · GCP

**Data**

PostgreSQL, row-level security · MongoDB · Neo4j · Vector embeddings

**AI and integrations**

Claude on AWS Bedrock · LLM applications · OCR / PaddleOCR · QuickBooks Online · Stripe · Bank feeds · Dropbox · OCPP / OCPI

## PUBLIC WORK

**doc-intake** — local OCR + deterministic accounting rules; documents file themselves or wait for a person. Tested, CI, live browser demo. github.com/mithundas79/doc-intake

**doc-intake-service** — the full-stack sibling: Python/FastAPI + React, native Tesseract OCR and a trained document-type classifier with honest metrics. github.com/mithundas79/doc-intake-service

**filing-agent** — a tool-calling LLM agent that cannot mark its own work done - fully open source (local Qwen 7B via Ollama), verbatim-evidence validation, bounded retries, a receipt for every run. github.com/mithundas79/filing-agent

## HOW I WORK

> Scope, acceptance criteria and risks written down and agreed before I build. Nothing is “done” until I have driven it myself on a deployed environment and shown the evidence — not a passing test, the real thing. Small reviewable pull requests, staging before production, a rollback path stated in every release. On my last platform that meant a 23-station staging certification and a one-page readiness scorecard, so a non-technical owner could see what was

> proven before each release rather than take my word for it. If I think a requirement is wrong I say so once, with the reason, and then build what you decide.

## EDUCATION

**University of Calcutta**— B.Sc., Science 1999 – 2003
